Keywords: cosmic mass; General Numbers; virtual universe

Abstract. What was asked, how it was answered (law and setup), what was found, and what kind of statement it is.

1 Introduction

Each body is one General Number, its cosmic mass $\mu = m + q\mathcal{G}$, with $\mathcal{G}^2 = 2s\cos\bar{\varphi}\,\mathcal{G} - s^2$ and $s = \sqrt{K/G_N}$ [2, 3]. State the question this paper answers.

2 Method

The engine, the law (L0, or a hypothesis such as L1a with its options), the settings as in `stamp.json`, and the pre-registration (where and when it was committed).

3 Results

Label every statement: MATHEMATICS for proved or verified statements, MEASUREMENT: source for measured values (with their source), FINDING OF THE VIRTUAL UNIVERSE, LAW L0 for results of the virtual universe, and HYPOTHESIS L1a for readings that are hypotheses.

Result	Value	Results folder
Example	$9.009 \times 10^{-19}\,e$	`results/T9.1/<run-id>`

Table 1: Every number traced to its results folder; say who reproduced it (decisions D14, D27).

4 Discussion

What the result means inside the virtual universe, and what it does not say about nature. The field law covers slow bodies and does not replace general relativity.

Reproducibility

Engine: cosmicmass 0.1.0, commit abc1234.
Repository: `https://github.com/MostafaDerraz/cosmic-mass-lab`.

Commands to re-run every result, the release, the seeds.

Contributions and AI use

Authors. First Author: conceptualisation, writing. Second Author: investigation, validation.
AI agents. Claude Opus 5.5 (Anthropic), in Claude Code, sponsor M. Derraz: software, validation.

AI agents are credited here and are not authors (decision D16 of the initiative; COPE and ICMJE guidance).

Acknowledgements

We thank everyone who takes part in the Co-exist initiative of Cosmic mass universe: the people and the AI agents who build the engine, run and reproduce the scenarios, ask and answer questions on the open board, review the papers and keep the records honest. This paper rests on that shared and open work, and on the generosity of every contributor who gave their time to it. We thank the members of the Board and the reviewers of this paper for their careful reading, and we acknowledge the theory of the cosmic mass and of General Numbers by Mostafa Derraz, on which the lab is built.

Declarations

Competing interests. The authors declare no competing interests.

Funding. This work received no specific funding. It was done as open, voluntary work of the Co-exist initiative of Cosmic mass universe.

Ethics. This work uses only simulations of the virtual universe of the Cosmic Mass Lab and published measurements. It involves no human participants, no animals and no personal data, and needed no ethics approval.

Data and code availability. The engine, the scenarios, the pre-registrations and every results folder cited here (with its `stamp.json`) are public at https://github.com/MostafaDerraz/cosmic-mass-lab; code under the MIT licence, documents and results under CC BY 4.0.

Use of AI. AI agents took part in this work as described in "Contributions and AI use". The human authors checked every result and every sentence and take full responsibility for the paper.

Publication. This is a **draft**. It has not been approved by the Board of the Co-exist initiative of Cosmic mass universe and must not be posted, deposited or circulated as a publication of the initiative, on Zenodo or anywhere else, before the Board's final approval. Posting it earlier breaks the rules of the initiative (`PUBLISHING.md`, section 7).

Review

This paper has not yet been reviewed by the Board of the Co-exist initiative of Cosmic mass universe.
